TITLE: Theory of transient processes in a circuit containing an electrochemical diode. 27

CITED SOURCE: Tr. Kazansk. aviat. in-ta, vyp. 73, 1963, 27-49

TOPIC TAGS: solion, transient process

TRANSLATION: Transients in solions are considered when the processes are describable by the laws of semi-infinite linear diffusion and when the migration forces can be accounted for by the bulk resistance of the solution. For the near-electrode region, a boundary diffusion problem is solved, and general relations connecting the boundary carrier concentrations and current with the applied voltage are found. Nonlinear integral equations describing the diffusion processes, with an allowance for migration are set up; by their approximate solution, a transient response of a solion terminated by a resistance is found. Effects of the applied voltage, initial carrier concentration, micro- and macro-electrode area and other parameters upon the solion transient current and its time constant are

Cord. 27

L 41794-65

TITLE: Solion theory

SOURCE: Kazan. Aviationsnyy Institut. Trudy, no. 82, 1964. Radiotekhnika i elektronika (Radio engineering and electronics), 34-57

TOPIC TAGS: solion, solion theory, electrolytic cell, ion current, current density, electrolyte

ABSTRACT: The principle of operation of the solion is set forth. Transient and stationary currents in a solion caused by an arbitrary-shape emf are considered. Boundary conditions for the P. Delahey fundamental symmetrical-spherical-diffusion equations are established, and the connection between $i(t)$ and $E(t)$ is found by applying the H. Matsuda et al. method (Ztschr. f. Elektrochemie, Berichte, 1955, 59, pp. 494-503) for solving differential equations describing diffusion:

Card 1/2

L 28502-66

ACC NR: AT6005740

3

$$\frac{I(t)}{I_0} = \frac{\exp -E(t)}{U_1} \left[U_1 - \frac{d}{dt} \int_0^t F_1(t-\tau) I(\tau) d\tau \right] = \frac{\exp -E(t)}{U_2} \left[U_2 + \frac{d}{dt} \int_0^t F_2(t-\tau) I(\tau) d\tau \right], \text{ where:}$$

$$\bar{t} = \frac{RP}{RT} t; \bar{F}_v = -\frac{RP}{RT} F_v; U_v = \pi PSC_v; F_v(t) = \frac{a}{D_v} \left[1 - \exp(-tD_v/a^2) \operatorname{erfc} VtD_v/a^2 \right] \quad (v=1,2)$$

As the above integral equation cannot be solved in a closed form, an electrical simulator of the equation is introduced. The simulator consisting of a semi-infinite RC-cable shunted by a resistor permits developing formulas for the transient and stationary I-V characteristics of the solution. TITLE: Electrolytic fraction-differentiating and integrating two-terminal network

CITED SOURCE: Tr. Kazansk. aviat. in-ta, vyp. 82, 1964, 58-66

TOPIC TAGS: electrolytic differentiator, electrolytic integrator

TRANSLATION: A possibility has been theoretically and experimentally proven of creating an electrochemical two-terminal network (a two-electrode cell) which would carry out differentiation or integration operation. Its passband (with an error of 20%) lies within 0.03- 240 cps. The upper boundary frequency can be increased up to 1.6 kc by connecting in series an accurately calibrated resistor. The permissible amplitude of the converted voltage is 50 mv. The nonlinear distortion factor is % or less. The cell can be used for simulating heat-conductance processes, for fractional one-half order differentiation (integration), and also for shortening pulses.

TITLE: The reduction of germanium by zinc amalgam in the presence of copper

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 17, 1962, 98, abstract 17V78 (Izv. AN KazSSR. Ser. khim., no. 2(20), 1962, 38-41 [summary in Kaz.])

TEXT: In the reduction of Ge by Zn amalgam the presence of Cu ions in the solution has a great influence on the relation between the different products of reduction: increasing greatly the quantity of Ge, which is changing into amalgam, and lowering the quantity of suspended elementary Ge. Similar effect has the presence of Cu in amalgam when Ge is reduced on the Hg cathode. The reason of such an effect of Cu is its reaction with Ge under the formation of intermetallic compounds. [Abstracter's note: Complete translation.]

TITLE: Germanium reduction in the presence of nickel and cobalt ions

SOURCE: Akademiya nauk Kazakhskoy SSR. Institut khimicheskikh nauk.
Trudy. v. 9. Alma-Ata, 1962. Elektrokhimiya rastvorov i
metallicheskikh sistem, 151-156

TEXT: The effect of nickel and cobalt on the behavior of germanium during its cementation with zinc amalgam was studied by a method described previously (Izv. AN KazSSR, ser. khim., 2(20) 38 (1962)). It was shown that the smallest amounts of nickel in the solution are sufficient to transfer germanium, except for a very small portion, into the amalgam. The potential of zinc amalgam remains practically unchanged. When the concentration of Ni in the solution is increased, germanium is reduced slowly but completely, nickel being cemented first of all. Simultaneously, the potential of zinc amalgam is slightly shifted toward positive values. The electrolysis of germanium salt with a mercury cathode in the presence of nickel ions, as well as on nickel amalgam, showed that nickel ions in

Card 1/2

Germanium reduction in the ...

S/850/62/009/000/010/012
B117/B186

the solution, not metallic nickel atoms are responsible for the transfer of germanium into the amalgam. No satisfactory explanation of the effect of nickel ions on the germanium reduction could be given. The cementation of germanium with saturated zinc amalgam in the presence of cobalt showed that here again the germanium is reduced down to the elementary state, forming amalgam. Cobalt ions affect the process similarly to nickel ions, the only difference being that germanium and cobalt are cemented more slowly when larger amounts of cobalt are used. There are 1 figure and 8 tables.

TITLE On the Calculation of Open Circular Cylindrical Shells in Terms
of Normalized Trigonometric Series (O raschete otkrytykh
kruglovykh tsilindricheskikh obolochek v poperechnykh trigo-
nometricheskikh ryadakh)

PERIODICAL Tr. Tallinsk. politekhn in-ta, 1956, Vol A, Nr 82, pp 71-82

ABSTRACT. For a short open circular cylindrical shell, all of whose edges are hinge-supported, formulae are written for the stresses and strains caused by displacements of its curvilinear edges and by the effect of symmetrically distributed tangential and normal loads. The solutions are obtained in two versions 1) by starting with the equation for the large variability exponents of the stress distribution

$$\frac{\delta^2}{12 R^2 (1 - \mu^2)} \Delta \Delta \Delta \Delta \varphi + \frac{\partial^4 \varphi}{\partial \xi^4} = 0$$

Card 1/2 wherein δ is the shell thickness, R its radius, μ the Poisson

SOV/124-58-7-7877

On the Calculation of Open Circular Cylindrical Shells (cont.)

ratio, ξ and ϕ dimensionless coordinates, and Δ the Laplace operator; and 2) by starting the equation of the semimomentfree theory of V. Z. Vlasov. In both cases the potential function is sought in the form of an expansion into a trigonometric series with respect to the variable ϕ (a normalized series). The Poisson ratio μ is assumed to equal zero.

AUTHOR: Nigul, U.K.

TITLE: Linear equations free of hypotheses of the dynamics of an elastic shell of a circular cylinder

PERIODICAL: Referativnyy zhurnal. Matematika, no. 10, 1961, 59-60,
abstract 10 B 271. ("Tr. Tallinsk. politekhn. in-ta", '960.
A, no. 176, 68 p., illustrated)

TEXT: Without the usual hypotheses (on the perpendicularity of the normal to the middle surface) the author develops a theory of improved static and dynamic equations of shells of circular cylinders. The shell is understood as a three-dimensional region in which the shifts and tensions are approximated by a Taylor series in terms of the normal coordinate. The system of characteristic equations becomes hyperbolic if in the series an odd number of terms is considered. The author investigates the influence of the corrections appearing by the consideration of the tensions σ_{13} , σ_{12} and σ_{33} ; an analysis of the results of other authors is carried out.

TOPIC TAGS: wave mechanics, flat plate, shell structure, solid dynamics

ABSTRACT: The development of the linear theory of wave propagation in elastic solids caused either by quick variations or movements of the loading is reviewed on a worldwide scale with emphasis placed on the transient processes of wave propagation in plates and shells.

The methods (analytical and energetic) of reducing three-dimensional problems to two-dimensional problems of constructing analytical design models and approximate theories of plates and shells, as well as of deriving the approximate equations for motions of elastic plates, and of cylindrical and spherical shells are critically discussed.

Card 1/5

L 53734-65

ACCESSION NR: AP5015744

The use of methods of integration in treating problems associated with wave processes (Fourier method, method of integral transformations, and others), the role of modes in the theory of steady and unsteady vibrations, and the modes of asymmetrical and symmetrical deformation of plates and shells are critically reviewed.

Works on particular problems of transient wave processes, and the use of approximate theories in dynamic stress analysis of plates and shells (elementary theories of compression-tension and torsion, of flexure, the Timoshenko-type theory), as well as the use of three-dimensional theory, are surveyed. The few publications on less thoroughly investigated (only by means of two-dimensional theories) unsteady wave processes in circular cylindrical and spherical shells and associated problems (for example, the action of shock waves upon plates and also cylindrical and spherical shells) are briefly discussed.

At the end, the authors formulate and discuss basic problems in the dynamics of plates and shells which have to be dealt with in the future: 1) to discover the types of possible elementary dynamic states of stress and

Card 2/3

L 53784-65

ACCESSION NR: AF5015744

to construct approximate equations (models) for describing these states with a certain degree of accuracy; 2) to develop methods for resolving the dynamic state of stress into elementary states when solving particular problems (that is, states related to loading, to certain properties of the object, et cetera); and 3) to develop the existing methods and to work out new methods of integrating the approximate equations which describe these states of stress.

The implementation of computer techniques will probably permit studying problems associated with transient wave processes in shells by using the equations of the three-dimensional theory and solving them on high-speed computers (that is, by the method of finite differences). The authors state in a footnote that such problems have been solved recently at the Institute of Cybernetics of the Estonian Academy of Sciences, by the method of three-dimensional nets. The reader is reminded that even the static problems analogous to (1), (2), and (3) are completely solved only for

Card 3/5

L 53784-65

ACCESSION NR: AP5015744

the simplest objects within the bounds of the Kirchhoff-Love theory, and that dynamical problems have to be treated on the basis of three-dimensional theory, although their initial investigation by means of the approximate theories deserves a great deal of attention.

The present state of the investigation of each of the three problems is discussed in detail. The accuracy and applicability of approximate theories should be improved, and it would be expedient to concentrate more attention on the analysis and application of derived equations than on their construction.

Some dynamic problems of a general character which have to be studied (for example, the effects of absorption and dissipation of energy on wave propagation in elastic plates and shells, the mathematical simulation of physical boundary conditions and of real loading, the use of the Saint-Venant principle in the dynamic theory of elasticity, and the study of the effect of deformation of the construction bordering the shell) are mentioned and ways for solving them are indicated.

TITLE: The theory of wave processes in the axially symmetric deformation of spherical shells

SOURCE: Inzhenernyy zhurnal. Mekhanika tverdogo tela, no. 1, 1966, 74-80

TOPIC TAGS: solid mechanics, stress distribution, spheric shell structure, elastic deformation, Laplace transform

ABSTRACT: The intermediate wave process as in the deformation of spherical shells when the shell is subjected to sudden loading at its poles is analyzed. The Timoshenko-type equations of motion

$$\begin{aligned} & [k^{-2}(\partial_\phi^2 + \operatorname{ctg} \varphi \partial_\tau - \operatorname{ctg}^2 \varphi - v) - 1] (1 + a^2) \partial_\tau^2 u + (1 - 2a^2 \partial_\tau^2) \psi + \\ & + [1 + k^{-2}(1 + v)] \partial_\phi u = 0 \\ & (1 - 2a^2 \partial_\tau^2) u + [k^{-2}a^2(\partial_\phi^2 + \operatorname{ctg} \varphi \partial_\phi - \operatorname{ctg}^2 \varphi - v) - \\ & - 1 - a^2 \partial_\tau^2] \psi - \partial_\phi w = 0 \\ & [1 + k^{-2}(1 + v)] (\partial_\phi + \operatorname{ctg} \varphi) u - (\partial_\phi + \operatorname{ctg} \varphi) \psi + [-(\partial_\phi^2 + \operatorname{ctg} \varphi \partial_\phi) + \\ & + (1 + a^2) \partial_\tau^2 + 2k^{-2}(1 + v)] w = 0 \end{aligned}$$

Card 1/2

L 39896-65

ACC NR: AP6011131

are Laplace-transformed to give the algebraic equations

$$[k^{-2}(-y + 1 - v) - 1 - (1 + a^2)s^2]u^L + (1 - 2a^2s^2)\psi^L + \\ + [1 + k^{-2}(1 + v)]w^L = 0$$

$$(1 - 2a^2s^2)u^L + [k^{-2}a^2(-y + 1 - v) - 1 - a^2s^2]\psi^L - w^L = 0$$

$$y[1 + k^{-2}(1 + v)]u^L - y\psi^L - [y + (1 + a^2)s^2 + 2k^{-2}(1 + v)]w^L = 0.$$

For $s \rightarrow \infty$, the method of inverse contour integration is used to study the wave processes at the propagation front. This asymptotic analysis yields expressions for the stress distribution on the shock front. These results are applied to the case of a spherical shell with a uniform load applied suddenly at the poles. Numerical results are obtained and compared with the axially symmetric wave processes in a slab. The authors thank M. Peterson for programming and carrying out the numerical calculation on the ETsVM Minsk-2. Orig. art. has: 35 equations and 2 figures.

TITLE: Comparative results of the lattice method and the method of steepest descent in the analysis of transient wave processes in slab deformation

SOURCE: Prikladnaya matematika i mehanika, v. 30, no. 2, 1966, 375-378

TOPIC TAGS: elastic deformation, wave propagation, numerical method, Laplace transform, approximation method, integration

ABSTRACT: Three different approximate integration methods are compared with each other in the solution of a Timoshenko problem of the type

$$[(k^2 - \delta_1) W - \theta_1 \psi = 0, \quad 2\theta_1 W + (k^2 - \delta_1 - 3) \psi = 0]$$

The physical problem is that of a deformation wave process in a semi-infinite slab subjected to a suddenly applied uniform moment at the slab edge. The boundary conditions of the problem are of the form

$$W(0, v) = \frac{2C}{3 - 3v} H(v), \quad W(0, v) = 0, \quad C = \text{const}$$

$$v = 0.3, k^2 = 0.860, C = 1$$

The above equations are Laplace transformed and their solutions written in the form

Card 1/2

2

L 25993-66

ACC NR: AF6012556

where

$$W^L = C \sum_{j=1}^J B_{Wj} e^{-\lambda_j t}, \quad V^L = C \sum_{j=1}^J B_{Vj} e^{-\lambda_j t},$$

$$B_{Wj} = \frac{(-1)^j}{s(\lambda_0^2 - \lambda_j^2)}, \quad B_{Vj} = \frac{(-1)^j (s - \lambda_j)}{s \lambda_j (\lambda_0^2 - \lambda_j^2)}$$

$$\lambda_j = \left(\frac{s^2}{2} \left[(1 + k^2) \pm (1 - k^2) \left(1 - \frac{12k^2}{s^2(1 - k^2)} \right)^{1/2} \right] \right)^{1/2} \quad (j = 1, 2)$$

The three methods for the approximate solution of these equations are: a) the method of steepest descents; b) an expansion of the transformed equations in negative whole powers of the Laplace transform parameter s , and c) an improved lattice-point or grid method. Results are obtained for the displacement W , bending moment M , and the transverse load Q , using all three methods. These results show that methods (a) and (c) give increasingly close values for M and Q as the time t increases. Agreement in W between methods (a) and (c) are good only for very long times. It is then concluded that the relatively new method (c) is quite reliable. Orig. art. has: 12 equations and 1 figure.

Title : Fluorescence Spectra of Kerosenes

Orig Pub : An. stiint. Univ. Iasi., 1956, Sec. 1, 2, No 1-2, 199-210

Abstract : Four grades of kerosenes were investigated. In three-minute photography on the E31 Hilger spectrograph there was observed fluorescence in the region of 3200-4600 Å. The glow in the region of the wave lengths longer than 3700 Å, due to the presence of polycyclic compounds (principally anthracene) is observed in kerosenes that were distilled to high temperatures. Kerosene distilled to 272° C practically does not glow in this region. When the kerosenes are diluted in ether, the fluorescence in the region of wavelengths greater than 3700 Å vanishes rapidly. But at the same time there appears and also vanishes a glow in the region $\lambda < 3200$ Å. At greater dilutions, one observes only the fluorescence in the region 3200-3700 Å.
